Performance Monitoring System for Leukaemia Diagnostic Interpretation Programme

Outline

This programme is designed to assess a laboratory's ability to diagnose leukaemia using a full spectrum of laboratory tests. No samples are issued for this, the programme is totally webbased.

Trial Frequency

Each trial (send out) is issued bimonthly (minimum 4 times and maximum 6 times per annum).

Scoring System Classification

The scoring system is based upon the Correct Diagnosis established by an expert panel/committee. A performance score is produced on the basis of comparing a participant's diagnosis returned to the correct diagnosis.

Scoring System Operation

Performance Scores are assigned by comparing a participant's submitted diagnosis to the Correct Diagnosis which has been established by an expert panel/committee from all of the data provided including clinical presentation, morphology, immunophenotype, cytogenetic and molecular genetic data. On rare occasions, this may not be the consensus diagnosis. A score of zero will be assigned to participants who select the Correct Diagnosis.

The consensus diagnosis is the diagnosis selected by the majority of participants.

A Differential Diagnosis is such that the diagnosis is deemed plausible in the absence of further pathological tests, and the majority of the Expert Committee is in agreement. If your diagnosis falls into this category, you will be assigned a score of zero.

An Incorrect Diagnosis is one that does not utilise all of the available information to establish either the correct or differential diagnosis. It could also be a diagnosis that may lead clinicians to give sub-optimal therapy. This classification would also be used where a submitted

Document Unique Reference: view_only. Due for review on: 02-Jun-2025 Author(s): Alison Whithy diagnosis has either assumed or introduced pathologies other than those provided in the trial data set. This performance is classed as unsatisfactory and will attract a score of 50.

The table below shows the performance scores assigned for the various diagnosis classification.

Definition of diagnosis	Score Assigned	
Correct	0	
Differential	0	
Incorrect	50	

Any laboratory/individual that fails to return a result by the closing date will be treated as having selected an incorrect diagnosis. If your laboratory only undertakes immunophenotyping, but diagnostic interpretation is performed elsewhere, it is important that the laboratory/centre that ultimately performs the diagnostic interpretation completes the Leukaemia Diagnostic Interpretation section.

The running score is a running cumulative of the performance scores over the last 3 exercises, thus the latest performance score will replace the oldest score of the three.

A running score of 100 or above is classed as persistent unsatisfactory performance but the Leukaemia Diagnostic Interpretation Programme is currently classed as educational and therefore no action is taken regarding persistent unsatisfactory performance.

As with all scoring systems, it is important to note that these will be constantly reviewed to determine whether they are providing the information required. The director and deputy director of the scheme retain the discretion to determine if an individual trial should not be scored.
